1. Abstract

This proposal has been drafted in order to meet the requirements of course COM 344 as project work offered by the Department of Management Informatics and Communication. Shakriya is built with a simple yet powerful goal to help people find jobs and help employers find the right people. Whether it's a company looking for skilled staff or a local business owner in need of a helping hand, Shakriya creates a space where opportunities and talent can meet. It's also a great tool for individuals searching for work that fits their skills and interests. Easy to use and accessible to everyone, Shakriya aims to make job searching and hiring more straightforward and efficient. This project will be implemented using the following technologies:

Front end: HTML, CSS, Javascript

Backend: PHP

Database: MYSQL

3. Background and Introduction

In today's dynamic job market, connecting the right talent with the right opportunity remains a challenge especially at the local and community level. Most existing platforms prioritize large-scale or international recruitment, often making it difficult for small business owners or individuals to find or offer work in their own areas. There is a growing need for a system that simplifies this process while making it more accessible and relevant for everyday users.

This is where Shakriya steps in as an innovation online platform developed to bridge the gap between employers and job seekers, with a strong emphasis on local employment and community-driven connections. The idea behind Shakriya is simple but powerful: to help people find jobs and help businesses find the right people efficiently, affordably, and nearby.

What sets Shakriya apart is its dual functionality. On one hand, employers and business owners can post job openings, define their specific requirements, and easily search for suitable candidates. On the other hand, individuals can only apply for listed jobs but also create their own profiles showcasing their skills, experiences, and interests. This means that instead of always waiting for job posts, skilled individuals can also be approached directly by businesses looking for what they offer similar to how platforms like Fiverr and Upwork operate, but with a strong focus on local and accessible job matching.

This feature-rich approach empowers freelancers, part-timers, and even skilled workers without formal resumes to be discoverable based on what they can do whether it's graphic design, plumbing, tutoring, tailoring, or digital marketing. It creates a two-way street where both job providers and job seekers can take initiative, connect, and grow.

Designed to be intuitive and user-friendly, Shakriya aims to support all users regardless of technical background and foster local economic activity. The platform promotes transparency, flexibility and opportunity, helping people showcase what they're good at and connect with those who need it.

System Architecture

4. Problem Definition

In today's evolving job market, the process of finding the right job or the right candidate remains a significant challenge particularly at the local and community level. While large-scale platforms like Fiverr and Upwork have revolutionized freelancing and remote work globally, they often cater to highly competitive digital niches and overlook the everyday needs of local businesses and individuals with practical, hands-on skills.

Small business owners, startups, and independent employers frequently face difficulties sourcing the right talent for specific tasks, especially within limited timeframes and budgets. At the same time, many skilled individuals such as electricians, tutors, designers, writers or laborers often lack access to platforms where they can showcase their abilities and be directly approached for relevant opportunities.

Current solutions in the market tend to be either too broad, too expensive, or too complex for these user groups. There is a clear gap in the availability of a localized, skill-oriented platform that enables both job seekers and employers to connect efficiently based on real needs.

Shakriya seeks to address this gap by offering a unified digital space where:

- Employers and business owners can post job requirements with specific skill criteria.
- Individuals can create detailed skill-based profiles, increasing their visibility and chances of being contacted directly.
- Local opportunities are prioritized, enabling more efficient, timely and community-focused hiring.
- The features combine the flexibility of freelancing platforms with the simplicity of job listing boards tailored to support localized and practical employment.

By doing so, Shakriya not only streamlines the hiring process but also empowers individuals to present their skills professionally and be discovered by those who need them. It creates a mutually beneficial ecosystem that supports local economies and promotes inclusive access to work opportunities for everyone.

4. Literature Review

The evolution of digital platforms has significantly transformed the employment landscape, offering innovative ways to bridge the gap between job seekers and employers. In recent years, several studies have highlighted the role of technology in enhancing employment accessibility, especially through platforms that prioritize skills over formal credentials. These platforms have redefined traditional recruitment processes by enabling individuals to market their capabilities directly to prospective employers, thereby promoting a more inclusive and dynamic job market.

Freelance marketplace such as Fiverr and Upwork have demonstrated the potential of digital solutions in connecting service providers with clients across various industries. These platforms emphasize flexibility, skill-based work, and self-promotion, allowing users to earn income based on their individual talents. However, such systems are often limited by global competition, language barriers, or complex payment infrastructures, which may exclude local workers or those lacking formal digital literacy.

The Shakriya platform emerges in response to these gaps, aiming to provide a more accessible, community-oriented alternative tailored to local employment needs. It builds on the concept of digital labor marketplaces while adapting it to support informal workers, local businesses, and community members seeking short-or long-term employment. By allowing users to create skill profiles, the platform encourages individuals to showcase their abilities in a way that is visible and searchable by employers.

Existing literature also emphasizes the growing importance of localized digital platforms that address regional employment challenges. Studies suggest that when platforms are designed with local context and user behavior in mind, they lead to higher engagement, trust, and better employment outcomes. Shakriya aligns with these findings by focusing on ease of use, cultural relevance, and direct communication between users.

In summary, the development of Shakriya is grounded in contemporary research that supports the use of digital platforms for employment facilitation. By focusing on skills, local engagement, and simplicity, it aims to foster meaningful connections between individuals and employment opportunities, ultimately contributing to economic empowerment and workforce development.

This literature review looks at how researchers and experts have explored the role of technology in changing the way people find jobs and how employers hire. Their work shows how digital platforms are making it easier for individuals to connect with opportunities based on their skills, not just qualifications. Inspired by these ideas, Shakriya is designed to help people especially in local communities like ours showcase what they can do and find work that suits them, while also helping employers find the right people more easily. Some of the summary of related research paper are as follow:

1.Optimizing job matching efficiency:A novel employment information system algorithm: Optimizing job matching in the labor market is crucial, and a novel employment data system leverages machine learning and advanced analytics to enhance efficiency by focusing on precise matching, continuous learning, and dynamic adaptability. Unlike traditional keyword-based approaches, the system uses natural language processing (NLP) to analyze resumes and job descriptions, understanding context and semantics for better fit assessments while evaluating skills, qualifications, and experience. By dynamically adapting to real-time job market trends and providing regular updates, the algorithm ensures up-to-date recommendations for job seekers and employers, ultimately improving predictive accuracy and reliability in the hiring process over time.

2.Mobile Based Platform for Technical Role Searching and Providing for Technical Role Searching and Providing for Freshers:This research study focuses on developing a job search and recruitment mobile app using Flutter and Dart to connect job seekers and employers on a unified platform. The app facilitates online hiring processes and job fairs, allowing employers to review applications and candidate details while enabling job seekers to explore opportunities, apply for positions, and track their results. Flutter, an open-source UI toolkit, enables cross-platform app development for Android, iOS, web, and desktop from a single codebase, while Dart serves as the object-oriented programming language for building responsive applications. The platform integrates Firebase for backend services, including real-time databases and authentication. The study highlights the platform's benefits, such as streamlining recruitment recruitment, fostering professional connections, and enhancing hiring efficiency for employers while improving job search accessibility for candidates. The combination of Flutter and Dart ensures an engaging user interface, and Firebase provides a scalable backend, making the solution efficient and user-friendly for both parties.

3.Does the Internet Help the Unemployed Find Jobs: This study examines whether using the Internet for job search improves employment prospects for unemployed workers. To address potential self-selection bias-where individuals who search online may differ systematically from those who do not- the analysis employs an instrumental variable(IV) approach. The IV strategy exploits pre-Internet differences in computer usage across occupations, as occupations with higher initial computer adoption saw faster uptake of Internet job search methods.

The study uses data from the Current Population Survey (CPS), combining the September 1992 Basic Monthly CPS with the December 1998, August 2000, and September 2001 CPS Computer and Internet Use Supplements. Unemployed workers are tracked longitudinally for up to 15 months to observe their employment outcomes.

The IV estimates reveal that unemployed workers who search for jobs online are approximately 14 percentage points more likely to find employment within 15 months compared to those who do not use the Internet for job search. This translates to a 26% increase in the job-finding rate at the mean. The findings suggest that Internet job search significantly enhances reemployment chances, highlighting its effectiveness as a tool for reducing unemployment durations.

4. Job Searching on the World Wide Web: The Internet has become a vital resource for both job seekers and employers, offering a wide range of tools to connect talent with opportunities. From job boards and career development platforms to company profiles and networking sites, employment-related resources are now accessible across various online channels, including listservs, newsgroups, and the World Wide Web. This article examines how the Web, in particular, serves as a powerful tool for job hunting and career advancement, highlighting its unique advantages in today's digital job market.

With the rise of online recruitment, job seekers can now explore openings, research companies, and even build professional networks with just a few clicks. Meanwhile, employers leverage these platforms to reach a broader pool of candidates efficiently. This article delves into the capabilities of the Web as a dynamic and interactive medium for career growth, showcasing how it transforms traditional job search methods into a more streamlined and accessible process.

For our project, we have taken references of such job finding website platforms available in the market like: Fiverr, Upwork, LinkedIn, Toptal.

Fiverr is a popular freelance platform where people offer digital services like graphic design, writing, video editing, and more. Freelancers, called sellers, create profiles and list their services, while clients search for the right fit.

Upwork is a well-known freelancing platform where clients and freelancers connect for projects like writing, design, coding and more. Freelancers create detailed profiles and bid on jobs that match their skills.

LinkedIn is a professional networking platform where people connect for jobs, career growth, and industry insights. Many companies post job openings there, and recruiters often reach out directly to potential candidates.

Toptal is a platform that connects companies with top freelance talent in fields like software development, design, and finance. They focus on reviewing experts to ensure only the best professionals are available for clients.

6. Objective of the Project

- To connect employers and job seekers through a simple and user-friendly online platform.
- To allow individuals to showcase their skills and be discovered by local businesses.
- To help small businesses and startups find the right talent quickly and affordably.
- To support local employment by promoting community-based job matching.
- To combine key features of freelancing platforms with localized job search functionality.
- To make job searching and hiring more accessible, efficient, and transparent for all users.

7. Significance of study

The study and development of Shakriya is significant in today's employment landscape, where the gap between job seekers and employers especially at the local level remains a persistent challenge. While many digital platforms exist to support hiring and freelancing, they often overlook the needs of small businesses and individuals who require more localized, accessible, and skill-based connections.

Shakriya addresses this gap by creating a platform where people can not only search for jobs but also showcase their unique skills and talents. This shift from traditional job seeking methods empowers individuals to take control of their professional journeys, making them more visible to those actively looking for services they can provide. For employers, especially those running local businesses, Shakriya offers a streamlined and efficient way to find the right people without going through time-consuming and expensive recruitment processes.

The significance of this study also lies in its contribution to promoting community based economic development. By encouraging the use of digital tools to support local employment, Shakriya fosters greater engagement, flexibility and inclusivity in the job market. It benefits students, freelancers, part-time workers, and skilled laborers alike, opening up opportunities that may otherwise remain hidden or underutilized.

Ultimately, this project highlights how thoughtfully designed solutions can simplify hiring, increase visibility for skilled individuals, and create a more connected and empowered workforce at the grassroots level.

8. Project Methodology

To ensure the successful planning, development, and delivery of the Shakriya platform, our team will follow a structured yet flexible project management methodology. We have chosen the Agile approach because it supports iterative development, encourages regular feedback, and enables us to adapt as the project evolves all of which are key to building a user-centered platform like Shakriya.

- 1) Project Management Approach: The agile methodology will guide the project from start to finish. This approach allows us to break the development process to smaller, manageable phases or "sprints", each focused on specific deliverables. Regular team meetings and progress reviews will help us stay aligned, address challenges early, and make necessary adjustments as we go. The iterative nature of Agile ensures that we can continuously improve the platform based on real-time testing and feedback.
- 2) Team: The project team consists of Four members, where two members will serve as the frontend developer, responsible for designing the user interface and implementing the frontend using HTML, CSS, Javascript. Other team member

will be focusing on backend development using PHP. Each team member will work together throughout this project to ensure that each part is completed on time and meet the required quality standards.

- 3) Design : In the design phase, the team will create a comprehensive design document outlining the structure and layout of the website. This includes wireframes, navigation flow, menu and button placement, and initial content drafts. Visual consistency and user-friendliness will be top priorities, ensuring that Shakriya is not only functional but also easy to navigate and visually appealing for all users.
- 4) Development : Once the design is finalized we will move into the development phase. Here, each feature will be developed incrementally, tested, and redefined. Coding standards and best practices will be followed to ensure the platforms secure, efficient and maintainable. The frontend and backend components will be integrated seamlessly, and the database will be configured to store essential information such as user profiles, skill listings, job posts and communications.

- The software requirements for the proposed Shakriya website:
- Frontend Development :

HTML: For styling the web pages.

CSS: For styling and layout

JavaScript: For adding interactivity and enhancing the user experience.

- Backend Development:

PHP: For handling business logic, user sessions, and backend services.

- Database Management:

MySQL: To securely store and manage user data, job listings, skill profiles, and more.

These software components form the foundation of the Shakriya website, enabling the creation of a user-friendly frontend interface, robust backend functionality, and efficient database management.

- Hardware requirement:

Since our project will be simple with a lightweight framework, no high-end hardware is required.

- **Timeline:**

Over the course of 10 weeks, the development of the website follows thoughtful and well-structured journey. We begin with the all-important planning and preparation, which takes place during first two weeks. During this time, we lay the foundation for the project organizing our ideas, figuring out what we want the site to do and gathering all the things we need. Moving into next two weeks, we dive deep into understanding our users both job seeker and employers. We explore similar platform, gather insights from potential users.

The creative energy takes over as we enter the designing phase. For two weeks, we get to be creative where our ideas take visual shape crafting clean, user-friendly layouts and interfaces that bring the Shakriya experience to life. Every button, color and layout is chosen with care to ensure it's simple, modern, and easy to navigate. For next three weeks, we turn our designs into fully functional website. We build features that allow both job seekers and employers to have seamless connections. The backend and database are carefully set up to handle user profiles, job listings, and interactions smoothly and securely.

Finally, we're almost ready to show off our hard work! In the last two weeks, we prepared the platform for launch, testing it thoroughly, making sure everything works just right, and optimizing it so that users can find us easily online. With excitement and pride, we launch Shakriya, ready to make a difference by connecting people with opportunities.

Gantt Chart

Gantt Chart

9.Expected Result

The successful completion of the Shakriya project is expected to result in the development of a fully functional, user-friendly online platform that effectively connects job seekers with employers, particularly within local communities. The platform will allow individuals to create profiles highlighting their skills and experiences, enabling potential employers or business owners to search for and reach out to candidates who meet their specific needs.

Through this initiative, Shakriya aims to simplify the hiring process by offering a more accessible and efficient alternative to traditional recruitment methods. By focusing on skills rather than formal credentials, the platform is expected to empower a wide range of users, including students, freelancers, skilled workers, and small business owners. It is anticipated that Shakriya will not only improve employment opportunities but also contribute to local economic growth by bridging gaps in the labor market and promoting community-level collaboration.

Overall, the project is expected to deliver a practical, inclusive and sustainable solution that addresses key challenges in job searching and hiring creating real value for both job seekers and employers alike.
